Do you or someone you know have autism?

The UCLA Center for Autism Research and Treatment (CART) is conducting a research study investigating the relationship between brain inflammation and the cognitive & behavioral symptoms of Autism Spectrum Disorders (ASD). Subjects will undergo positron emission tomography (PET) brain imaging before and after treatment with the antibiotic minocycline. This study will involve up to 9 visits to UCLA and the West Los Angeles VA Hospital over 16 weeks.

Eligible participants must be:

- Male
- Between 18 and 35 years of age
- Diagnosed with autism

Participants may receive up to $380
