The UCLA Center for Autism Research and Treatment (CART) is conducting a research study investigating the difference in brain inflammation between people with Autism Spectrum Disorders (ASD) and people without ASD. Subjects will undergo positron emission tomography (PET) brain imaging, and some volunteers will undergo a second PET scan. This study will involve up to 4 visits to UCLA and the West Los Angeles VA Hospital over 16 weeks.

Eligible participants must be:
- Male
- Between 18 and 35 years of age
- Never diagnosed with autism

Participants may receive up to $230
